Types of Kidney Stones

Not all kidney stones are made up of the same crystals. The different types of kidney stones include:

- ❑ **Calcium** : Calcium stones are the most common. They can be made of calcium oxalate (most common), phosphate, or maleate. Vitamin C and spinach contain oxalate. Calcium-based kidney stones are most commonly seen in young men between the ages of 20 and 30.
- ❑ **Uric Acid** : This type of kidney stone is more common in men than in women. They can occur in people with [gout](#) or those going through chemotherapy.
- ❑ **Struvite** : This type of stone is found mostly in women with urinary tract infection. These stones can be quite large and cause urinary obstruction.
- ❑ **Cystine** : Cystine stones are rare. They occur in both men and women who have the genetic disorder [cystinuria](#).

Types of kidney stone
